

Control-unit 5-channel 0-10V

Art.-No. 00020019-000

Controlcable to 0..10V-Ballasts

The Control unit has 5 outputs. Each output consists of one plus and one minus-screwclamp. The outputs deliver an active 0-10V signal. Each output can deliver a current of 20mA max.

The output channels are not isolated. This has the advantage that all minus-lines can be connected together.

The control unit is playing an animation from it's internal memory. This runs in a loop. To change this animation, the control unit must be connected with the included cable and adaptor to an PC. It is also necessary that the mains-power (230V/50Hz) is applied. A new animation can be made with the included software and then programmed into the control-unit. The software can also be obtained on our internet site: www.toni-maroni.de. At the time of transmitting the control-unit will stop the animation. After that it will start with the new animation.

The red "Power" LED shows that the mains-power is applied. The green "Status" LED is blinking in normal run.
